

Contents

Introduction	xiii
Chapter 1	
Elements of algebra in ancient Babylonia	1
1. Babylonian numerical algebra	1
2. Indeterminate equations	7
3. The origin of the first algebraic problems	9
Chapter 2	
Ancient Greek “geometric algebra”	11
1. Transformation of mathematics into an abstract deductive science. Discovery of incommensurability	11
2. Geometric algebra	15
3. Classification of quadratic irrationalities	20
4. The first unsolvable problems	21
5. Cubic equations	27
6. Indeterminate equations	30
Chapter 3	
The birth of literal algebra	35
1. Mathematics in the first centuries CE. Diophantus	35
2. Diophantus’ <i>Arithmetica</i> . Its domain of numbers and symbolism	37
3. The contents of <i>Arithmetica</i> . Diophantus’ methods	42
4. Algebra after Diophantus	47

Chapter 4**Algebra in the Middle Ages in the Arabic East and in Europe 49**

1. The emergence of algebra as an independent discipline 49
2. The first advances in algebra in Europe 55
3. Algebraic symbolism in Europe. The German cossists
and the development of algebra in Italy 59

Chapter 5**The first achievements of algebra in Europe 67**

1. The solution of cubic and quartic equations 67
2. The *Algebra* of Rafael Bombelli.
Introduction of complex numbers 71
3. François Viète 75
4. Creation of a literal calculus 77
5. Genesis triangulorum 80
6. Indeterminate equations in the work of Viète 85
7. Beginning of the theory of determinate equations 87

Chapter 6**Algebra in the 17th and 18th centuries 91**

1. The arithmetization of algebra 91
2. Descartes' treatment of determinate equations 93
3. The fundamental theorem of algebra 94
4. Gauss' criticism 98
5. The problem of solution of equations by radicals 100
6. Proof of the unsolvability of the general quintic by radicals 106

Chapter 7**The theory of algebraic equations in the 19th century 109**

1. Cyclotomic equations 109
2. Equations with an Abelian group 114
3. Galois theory 115
4. The evolution of group theory in the 19th century 120
5. The victorious “march” of group theory 125

Chapter 8**Problems of number theory and the birth of commutative algebra . 129**

1. Diophantine equations and the introduction of algebraic numbers	129
2. Kummer's ideal factors	135
3. Arithmetic in arbitrary fields of algebraic numbers. Ideal theory	137
4. Ideal theory in fields of algebraic functions	140

Chapter 9**Linear and noncommutative algebra 149**

1. Introduction of determinants	149
2. Linear transformations and matrices	151
3. The English school of symbolic algebra. Hamilton's quaternions	155
4. Algebras	158

Conclusion 161**Appendix: A new view of the geometric algebra of the ancients 163****References 175****Index 177**
